

Object Detection with YOLOv8 (Run detection.py script)

The documents inside the “**demo**” folder located in the relevant directory will be used.

- First, we will create an environment named **yolov8**. For this, refer to the file titled "Environment Creation".

After setting up the environment, if we have a code file written in .py format, we will run it:

- Open the environment named ``yolov8`` in the Anaconda Prompt terminal (**Python 3.10**, ``ultralytics``, and the libraries listed in ``requirements.txt`` must already be installed here).
- Go to the directory in the terminal where the ``py`` file is located (``yolov8``):
C:\Users\pc\Desktop\.....\demo>).
- Run the ``python detection.py --source data/images/road.png`` detection code for the road.png image inside data/images by typing in the terminal. Here is the result:

-
- Now let's run the video file located there:

Let's type ``python detection.py --source data/videos/road.mp4`` in the terminal. The video will run. We can exit the video by pressing ``q``.

- Finally, if we want to perform object detection via webcam, we can type:
`python detection.py --source 1``
